PANCHAL JAY

1. Define a class to represent a bank account. Include the following members:

Data Members:

- a.Name of the Depositor
- b.Account Number
- c.Type of Account
- d.Balance amount in the account

Data Methods:

- a.To assign initial values
- b.To deposit an amount
- c.To withdraw an amount
- d.To display name and balance.

```
import java.io.*;
import java.util.*;
import java.util.Scanner;
import java.util.Random;

class Bank
{
    public String nameOfDepositor;
```

```

public int accNumber;

public String accType;

public double balanceAmount;

public void assignValues(String nameOfDepositor, String accType, double
balanceAmount)
{
    this.nameOfDepositor=nameOfDepositor;

    this.accType=accType;

    this.balanceAmount=balanceAmount;

    Random random = new Random();

    this.accNumber=random.nextInt(1000000);

    System.out.println("Your new account number is: "+accNumber);
}

public void depositAmount(double amount)
{
    if(accNumber==0)

        System.out.println("!You don't have bank account to
deposit\nNote:please assign values to create an account");

    else

    {

        balanceAmount+=amount;

        System.out.println("Amount deposited successfully...");
    }
}

```

```

    }

}

public void withdrawAmount(double amount)

{

    if(accNumber==0)

        System.out.println("!You don't have bank account to credit\nNote:please assign values to create an account");

    else if(balanceAmount>amount)

    {

        balanceAmount-=amount;

        System.out.println("Amount credited successfully...");

    }

    else

        System.out.println("! Insufficient balance");

}

public void displayDetails()

{

    if(accNumber==0)

        System.out.println("!You don't have bank account\nNote:please assign values to create an account");

    else

    {

```

```

        System.out.println("Name of the Depositor: "+nameOfDepositor);
        System.out.println("Balance amount in the account: "+balanceAmount);
    }
}

public void getInput()
{
    System.out.println("How can i help you?");
    System.out.println("1. Open account");
    System.out.println("2. Deposit amount");
    System.out.println("3. Withdraw amount");
    System.out.println("4. Account details");
    System.out.println("5. Exit");
    System.out.print("Please Enter Your choose : ");
}
}

class PRG_01
{
    public static void main(String[] s) throws IOException
    {
        System.out.println("::::::::: WELCOME TO BANK OF BARODA ::::::::::");
        Bank newAccount=new Bank();
    }
}

```

```

Scanner scan=new Scanner(System.in);

3. Design a class Cricketer having data member name and a number of matches and appropriate member function to set the values. Derived two classes Batsman and Bowler from cricketer class with data member total number of runs and wickets respectively. Batsman class is having method to calculate average wicket. Write a program to create two objects and display information of one batsman and bowler along with average run and wicket.

```
import java.util.Scanner;

class Cricketer
{
    public String cname;

    public int nom;

    public void setDataMain()
    {
        Scanner sc = new Scanner(System.in);
```

```

        System.out.print("Enter the name of Cricketer: ");

        cname = sc.nextLine();

        Scanner sc2 = new Scanner(System.in);

        System.out.print("Enter the Number of matches of Cricketer: ");

        nom = sc2.nextInt();

    }

    public void displayDataMain()

    {

        System.out.println("Name " +cname);

        System.out.println("Matches " +nom);

    }

}

class Batsman extends Cricketer

{

    public int total_run;

    public float average;

    public void setData()

    {

        Scanner sc4 = new Scanner(System.in);

```

```
        System.out.print("\nEnter the Total Number of Runs: ");

        total_run = sc4.nextInt();

    }

    public void displayData()

    {

        System.out.println("Total Runs "+total_run);

    }

}
```

```
class Bowler extends Cricketer

{

    public int wickets;

    public float average;

    public void setData()

    {

        Scanner sc3 = new Scanner(System.in);

        System.out.print("Enter the number of wickets: ");

        wickets = sc3.nextInt();

    }

    public void displayData()
```

```

        {

            System.out.println("Wickets "+wickets);

        }

    }

public class PRG_03

{

    public static void main(String[] args)

    {

        Bowler bowl = new Bowler();

        Batsman bat = new Batsman();

        Cricketer cal = new Cricketer();

        cal.setDataMain();

        bat.setData();

        bowl.setData();

        cal.displayDataMain();

        bat.displayData();

        bowl.displayData();

        bowl.average = (float) bowl.wickets/cal.nom;

        bat.average = (float) bat.total_run/cal.nom;

```

```

        System.out.println("Average_Run's: "+bat.average);

        System.out.println("Average_Wicket's: "+bowl.average);

    }

}

```

Output :

```

D:\21bca135\JOURNAL-2>javac PRG_03.java

D:\21bca135\JOURNAL-2>java PRG_03
Enter the name of Cricketer: dhoni
Enter the Number of matches of Cricketer: 100

Enter the Total Number of Runs: 50000
Enter the number of wickets: 400

Wickets 400
Average_Run's: 500.0
Average_Wicket's: 4.0

```

4. Write a program that will accept two strings or two numbers from command line and create overloaded method that add these two numbers or concate two strings.

```

import java.io.*;

class PRG_04
{
    static boolean isNumber(String s)
    {
        for(int i=0;i<s.length();i++)
            if(Character.isDigit(s.charAt(i))==false)

```

```

        return false;

        return true;
    }

    void add(int a, int b)
    {
        System.out.println("Result is : "+(a+b)) ;
    }

    void add(String a, String b)
    {
        System.out.println("Result is : "+(a+b));
    }

    public static void main(String[] args)
    {
        PRG_04 obj = new PRG_04();

        if(isNumber(args[0])&&isNumber(args[1]))
        {
            int a=Integer.parseInt(args[0]);

            int b=Integer.parseInt(args[1]);

            obj.add(a,b);
        }

        else

```

```
        obj.add(args[0],args[1]);  
    }  
}
```

Output :

```
D:\21bca135\JOURNAL-2>javac PRG_04.java  
D:\21bca135\JOURNAL-2>java PRG_04 jay panchal  
Result is : jaypanchal
```

5. Write a program that accept a number from command line and check whether it is palindrome or not.

```
public class PRG_05 {  
  
    public static void main(String args[])  
    {
```

```

int n = Integer.parseInt(args[0]);

int sum = 0, r;

int temp = n;

while(n>0)
{
    r = n % 10;

    sum = (sum*10)+r;

    n = n/10;

}

if(temp==sum)

    System.out.println("It is a Palindrome No.");

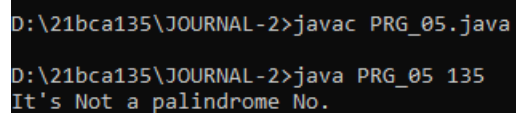

else

    System.out.println("It's Not a palindrome No.");

}

```

Output :

```

D:\21bca135\JOURNAL-2>javac PRG_05.java
D:\21bca135\JOURNAL-2>java PRG_05 135
It's Not a palindrome No.

```

6. Write a program that will accept a string from command line and arrange all the characters in alphabetical order.

E.g. input- computer output-cemoprtu

```
public class PRG_06
{
    public static void main(String args[])
    {

        String str = args[0];

        str = str.toLowerCase();

        int len = str.length();

        String sortedStr = ""; //Empty String
        for (char ch = 'a'; ch <= 'z'; ch++) {
            for (int i = 0; i < len; i++) {
                char strCh = str.charAt(i);
                if (ch == strCh) {
                    sortedStr += strCh;
                }
            }
        }

        System.out.println("Alphabetical order : "+sortedStr);
    }
}
```

```
}  
  
}
```

Output :

```
D:\21bca135\JOURNAL-2>javac PRG_06.java  
D:\21bca135\JOURNAL-2>java PRG_06 jay  
Alphabetical order : ajy
```

7. Write a program to create interface Area. Create three classes called rectangle, triangle and square calculate areas respectively.

```
import java.util.Scanner;
```

```
interface area
```

```
{  
    double calc(double x,double y);  
}
```

```
class rectangle implements area
```

```
{  
    public double calc(double x,double y)  
    {  
        return(x*y);  
    }  
}
```

```
    }  
}  
  
class triangle implements area  
{  
    public double calc(double x,double y)  
    {  
        return((x*y)/2);  
    }  
}
```

```
class square implements area  
{  
    public double calc(double x,double y)  
    {  
        return(x*x);  
    }  
}
```

```
class PRG_07  
{  
    public static void main(String arg[])  
    {  
        int p,q;
```

```

        Scanner in = new Scanner(System.in);

rectangle r = new rectangle();

triangle c = new triangle();

        square s = new square();

        area a;

a = r;

        System.out.print("\nEnter hight of Rectangle : ");

        p=in.nextInt();

        System.out.print("Enter width of Rectangle : ");

        q=in.nextInt();

System.out.println("\nArea of Rectangle is : " +a.calc(p,q));

a = c;

        System.out.print("\nEnter hight of Triangle : ");

        p=in.nextInt();

        System.out.print("Enter Breath of Triangle : ");

        q=in.nextInt();

        System.out.println("\nArea of Triangle is : " +a.calc(p,q));

a = s;

        System.out.print("\nEnter Side of Square : ");

        p=in.nextInt();

        System.out.println("\nArea of Square is : " +a.calc(p,p));

}

```

```
}
```

Output :

```
D:\21bca135\JOURNAL-2>javac PRG_07.java
D:\21bca135\JOURNAL-2>java PRG_07

Enter hight of Rectangle : 5
Enter width of Rectangle : 5

Area of Rectangle is : 25.0

Enter hight of Triangle : 4
Enter Breath of Triangle : 5

Area of Triangle is : 10.0

Enter Side of Square : 40

Area of Square is : 1600.0
```

8. Write a program that will accept a number from command line and raise a user defined exception if the number consists of odd number of digits.

```
class OddNumberOfDigitsException extends Exception {
    public OddNumberOfDigitsException(String message) {
        super(message);
    }
}

public class PRG_08 {
    public static void main(String[] args) {
        int numberString = Integer.parseInt(args[0]);

        int temp=numberString;
```

```

        int x;

        try {
            while(numberString>0){

                x=numberString%10;

                numberString=numberString/10;

                if (x % 2 != 0) {

                    throw new OddNumberOfDigitsException("The
number has an odd number of digits");

                }

            }

        } catch (ArrayIndexOutOfBoundsException e) {

            System.out.println("Please provide a number as a command-line
argument.");

        } catch (OddNumberOfDigitsException e) {

            System.out.println(e.getMessage());

        }

    }

}

```

Output :

```

D:\21bca135\JOURNAL-2>javac PRG_08.java
D:\21bca135\JOURNAL-2>java PRG_08 12345
The number has an odd number of digits

```

9. Write a java application which accepts 10 names of student and their age. Sort names and age in descending order. (Using Array)

```
import java.util.Arrays;
import java.util.Scanner;

public class PRG_09 {

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        String[] names = new String[10];
        int[] ages = new int[10];

        for (int i = 0; i < 10; i++) {
            System.out.print("Enter name of student " + (i + 1) + ": ");
            names[i] = scanner.nextLine();
            System.out.print("Enter age of student " + (i + 1) + ": ");
            ages[i] = scanner.nextInt();
            scanner.nextLine();
        }

        while (true) {
            System.out.println("\nSelect an option:");
            System.out.println("1. Sort via Name.");
            System.out.println("2. Sort via Age.");
            System.out.println("3. Exit");
            System.out.print("\nSelect Your Choice : ");
            int choice = scanner.nextInt();
            scanner.nextLine();

            switch (choice) {
```

case 1:

```
for (int i = 0; i < 10; i++) {  
    for (int j = i + 1; j < 10; j++) {  
        if (names[i].compareToIgnoreCase(names[j]) < 0) {  
            String tempName = names[i];  
            names[i] = names[j];  
            names[j] = tempName;  
            int tempAge = ages[i];  
            ages[i] = ages[j];  
            ages[j] = tempAge;  
        }  
    }  
}  
System.out.println("\nSorted Names in Descending Order:");  
for (int i = 0; i < 10; i++) {  
    System.out.println(names[i] + " - " + ages[i]);  
}  
break;
```

case 2:

```
for (int i = 0; i < 10; i++) {  
    for (int j = i + 1; j < 10; j++) {  
        if (ages[i] < (ages[j])) {  
            int tempage = ages[i];  
            ages[i] = ages[j];  
            ages[j] = tempage;  
            String tempname = names[i];  
            names[i] = names[j];  
            names[j] = tempname;  
        }  
    }  
}  
System.out.println("\nSorted Ages in Descending Order:");  
for (int i = 0; i < 10; i++) {  
    System.out.println(ages[i] + " - " + names[i]);  
}
```

```
        }
        break;
    case 3:
        System.out.println("Exiting program...");
        System.exit(0);
        break;
    default:
        System.out.println("Invalid choice. Try again.");
    }
}
}
```

Output :

```
D:\21bca135\JOURNAL-2>javac PRG_09.java
